27. Pathological distribution

28. Pathological description

Diffused flaring of the metaphysis of the long bones.  
 The sites affected on the bones present are; distal radius + ulna, proximal humeri, distal femur & proximal & distal metaphyses of tibiae.  
 This flaring of the metaphyses is a pathological lesion consistent with ~~osteoporosis~~ ~~osteomalacia~~  
 The bones are also "plump". This indicates infantile rickets.

55. Pathological Distribution

56. Pathological Description

- x Wedge shaped 5<sup>th</sup> lumbar (see over). Morphology likely to be due to advancing age. would have caused slight scoliosis of the spine.
- x lesion present at the distal end on the posterior side of left femur. ~~The~~ New bone formation has occurred at the distal end of linea aspera. The new bone measures 5.8 mm long x 6 mm in height. It is likely to be a soft-tissue injury causing calcification of muscle tissue due to a muscle tear.
- slight osteophyte formation present on L2-T11. T12 also has a Schmorl's node present on the inferior aspect of the vertebral body.

55. Pathological Distribution

56. Pathological Description

Fusion of T 4-11, "bamble wax" appearance & only situated on the right side of the thoracic vertebral bodies.  
Enthesophytes also present on the patellae, tibial tuberosities and on the insertion point for the a.ch. tendon on both calcanei.

Lesions are consistent with DISH.

56. Pathological Description

Heads of femora; ball joint is deformed - conical with large osteophytes around the edges of the balls. The joint surfaces are pitted with areas of eburnation and areas of new bone formation. Corresponding lesions are present on the acetabulum. Indicative of OA.

OA also present on C6 & 7 - bodies

Wedge of T11 & 10 present - degenerative - resulted in scoliosis (to the left) of the thoracic vert.
