# LEEDS PRIORY DOVECOTE, ABBEY FARM, LEEDS, KENT ARCHAEOLOGICAL BUILDING RECORDING AND WATCHING BRIEF 

## Summary

The dovecote which belonged to the former Leeds Priory in Kent remains standing as a roofless ruin whose condition has deteriorated seriously in the last 25 years. It forms part of the Scheduled Ancient Monument of the Priory and its condition has prompted a programme of emergency stabilisation and consolidation works. The interior of the dovecote contained important structural remains of the collapsed building, particularly its roof timbers, and the stabilisation works offered the opportunity of archaeologically recording and, where appropriate, retaining those remains. The Oxford Archaeological Unit oversaw the clearance of the interior of the dovecote, labelling each fallen timber and recording within which part of the building it was located. An assessment of was then made of the nature and function of each timber and whether it offered any potential for reuse. The internal and external walls of the dovecote were cleared of vegetation and were recorded using rectified photography. The principal finding of the work was to confirm that the basic form of the roof would have been as that shown in a survey and article written in 1973 by $J$ Caiger (see Bibliography).

## 1 INTRODUCTION

### 1.1 Background

1.1.1 The Oxford Archaeological Unit (OAU) was commissioned by Cluttons (Chartered Surveyors and Property Consultants) of Canterbury acting on behalf of the Rochester Bridge Trust to undertake a programme of building recording and archaeological watching brief during clearance works at the former dovecote at Leeds priory, near Maidstone in Kent (NGR: TQ 82225290). The clearance forms part of a long term management strategy for the dovecote and was carried out in advance of consolidation works to stabilise the building in its present condition and prevent further deterioration to the structure. There are no immediate plans to restore or rebuild the dovecote.
1.1.2 The dovecote is one of a group of buildings within the grounds of Abbey Farm in Leeds and forms part of the historic site of Leeds Priory, a Scheduled Ancient Monument (Kent SAM No 24346)

### 1.2 Aims and objectives

1.2.1 The principal aim of the current recording programme is to make as full an archaeological record as possible of the fallen timbers and other building materials before and during the works to clear them from the dovecote.
1.2.2 The recording is intended to enhance the understanding of the original form of the dovecote and its development over time. The recording was specifically targeted at the structural timbers and other features of the structure which were to be removed during the clearance. Only limited recording was undertaken of the walls and other elements of the building which were to remain intact and the archaeological programme was not intended to gain a complete understanding or record of the structure. It is anticipated that further recording of the dovecote will be undertaken as and when further construction or consolidation works to the structure are undertaken.

### 1.3 Methodology

### 1.3.1 The recording programme consisted of two main elements:

- the recording of the fallen timbers during their clearance from within the dovecote;
- rectified photographic recording of the walls of the dovecote.
1.3.2 The dovecote has clearly been derelict for many decades and prior to the start of the programme the external and internal walls were almost entirely obscured by thick ivy and other vegetation. The first stage of the programme was to remove the ivy from the walls and other upstanding vegetation within c .5 m of the building to allow a clear view of the walls for the photographic recording. This was undertaken by a nonspecialist contractor and in some isolated areas where the structural integrity of the walls was particularly poor it was necessary to leave some ivy in place for reasons of safety.
1.3.3 The next stage was the clearance of the fallen timbers from within the dovecote and this was undertaken under archaeological supervision. The interior was divided into five sections (the five structural bays) to allow the position of each fallen timber to be recorded. A label with an identifying reference was stapled to each timber and it was then stored in an adjacent covered shed. Each timber was measured, photographed and a rapid assessment made of its function, condition and potential for reuse (see Appendix 1). An example of each of the main types of structural member was drawn. A cautious approach was used during the initial retention and labelling of the timbers so that upon the subsequent analysis many timber fragments had been retained which were of such poor condition that it was impossible to tell which part of the structure they formed. It is anticipated that many of these timbers may be discarded while all the principal members will be retained to allow their possible reuse in the future.
1.3.4 After the clearance of the interior of the dovecote, numbered surveying targets were fixed to the walls at regular intervals and the walls were recorded using rectified photography.

### 1.4 Historical background

1.4.1 Extensive historical and documentary research has not been undertaken as part of the current project. The summary history included here is based largely upon evidence within the Victoria County History and a article in Archaeologia Cantiana 89 (Two Kent Pigeon Houses, Caiger, J 1974). Caiger's article is reproduced here as Appendix B
1.4.2 Caiger asserts that the smaller square building at the south end of the current building was the original dovecote and that it pre-dated the dissolution of the monastery in 1539. After its suppression the priory passed into the possession of Warham St Leger of Ulcombe and then to Francis Colepepper before being purchased around the turn of the $17^{\text {th }}$ century by William Covert. By 1610 it was in the ownership of William Meredith and Caiger believes that by this stage the small dovecote would have been inadequate for the large household and that this would have necessitated the construction of the large northern extension to the dovecote.
1.4.3 Caiger acknowledges that his is merely a 'possible chronology' rather than the establishment of a fixed date for the construction of the dovecote and that the evidence on which it is based is not fully conclusive. It is not the purpose of the current study to determine the exact chronology of the building and it may be that

Caiger's is accurate but the two surviving buildings are of similar construction and it would be surprising if the larger one was constructed a century after the smaller. More likely is that the original dovecote was on the site of the existing small square building but that it was demolished (possibly only partially) and rebuilt at a similar time on a larger scale.
1.4.4 The earliest conclusive evidence of the existence of the dovecote is a view of Leeds Abbey drawn by J Badslade in 1720 which has not been seen as part of this study but which is known to show a long pigeon house in the same location and of the same general dimensions as the current building but with no windows or floor-ventilation openings in the east wall. At this time the estate was still owned by the Meredith family but in 1765 it was sold to John Calcraft who proceeded to undertake a number of improvements to the estate which included some to the dovecote. Lancelot 'Capability' Brown is reported to have been commissioned to enhance the grounds and among his works is believed to have been the addition of two windows into the east wall of the building in order to give the dovecote the appearance of a chapel when viewed from a distance.
1.4.5 In 1790 the large mansion was demolished and shortly afterwards the more modestlysized Abbey Farmhouse was built. The farmhouse would not have required such a large dovecote and it appears likely that at sometime in the early $19^{\text {th }}$ century the major internal alterations were undertaken which included the insertion of a ground and first floor. Caiger's article reports that an elderly resident of Leeds recalls that in the early $20^{\text {th }}$ century hop-pickers were accommodated in the converted dovecote during the picking season.
1.4.6 Caiger's article was written in 1974 and it appears that at that date the dovecote was disused and derelict but at least the northern building was in a much better condition than it is currently in. Both buildings are described as 'roofless and in a ruinous condition' but a detailed description of the roof structure of the northern building is provided together with the staircase, the crowstep gable and the first floor. Presumably the roof was no longer water-tight, having lost many of its roof tiles but the trusses were still basically intact. Drawings of the building are also provided although it is likely that they include a certain element of reconstruction.

## 2 DESCRIPTION

### 2.1 Introduction: present condition

2.1.1 Prior to the start of the current works Leeds Dovecote was in a very poor condition. None of the roof timbers remained in-situ and little of the first floor structure survived. One first floor principal joist remained in-situ (although one end of the three other joists remained in their sockets) but none of the first floor boards or common joists remained intact. Each of the four ground floor principal joists remained in-situ, together with several common joists, although even many of these had largely disintegrated. Only tiny fragments of ground floor board remained. Each of the gables had been lost so that there was no indication of the crow-stepping to the north and the uppermost brick courses of the side walls had also collapsed or were so heavily covered in ivy that to remove all the vegetation would have destabilised the structure.
2.1.2 A large number of hand-made, pegged, clay roof tiles were found within the large dovecote and on the ground immediately surrounding it. Each of these was 24 cm x 15 cm with two diagonally set square peg holes towards one end. Some $20^{\text {th }}$-century machine made clay roof tiles were also found. Many of the hand-made tiles had
broken but several hundred intact tiles were retained and stored on site. Many bricks from the collapsed structure were also removed during the clearance and these were also stored within an adjacent building for possible future reuse in the dovecote. The bricks remaining in the building, and those from the collapsed structure were of fairly consistent size and measured c .26 cm by 12 cm by 6 cm .
2.1.3 A full archaeological survey and description of the building does not form part of the current commission but a brief description would be appropriate and Caiger's article provides a further description (Appendix 2).

### 2.2 General description

2.2.1 Leeds Dovecote consists of two sections: a small building to the south and a larger rectangular building to the north (See Fig. 2). The two buildings are of the same width and previously adjoined each other but a cross passage has been formed between them at the north end of the smaller structure. The north wall of this passage, which was formerly the division between the two buildings has now largely collapsed although it partially survives at low level, buried before the start of the current works. The later wall of the cross passage, within the smaller dovecote, remains.

### 2.3 Smaller building

2.3.1 The smaller dovecote is c. 5.2 m wide by c. 3.6 m long. It is constructed in red brick (English bond with rough diaper work) set on an uncoursed stone plinth and has a soft chalky lime mortar. There is a dressed stone quoin at the south-west corner and the south-east corner has been rebuilt in brick to suggest that the south wall may originally have continued further to the east. This may have merely been a butress similar to those on the east face of the larger building. The three external elevations are all plain (other than a four-centred plain chamfered arched doorway with stone quoins in the east wall) while the inner faces of each of these walls is lined with nesting boxes and alighting ledges ( 11 rows each to $\mathrm{E}, \mathrm{W}$ and S totalling c.360). The red brick north wall does not contain nesting boxes and is a secondary ( $19^{\text {th }}$ century?) insertion. The roof does not survive but it is reported to have been a simple hipped structure (Caiger 1974,.37).

### 2.4 Larger building

2.4.1 The larger dovecote is of similar construction to the smaller with red brick English bond brickwork set on a stone plinth. The east elevation is articulated by three partially collapsed brick buttresses, two at each end of the larger building and one towards the centre and it is ornamented by fragmentary diaper brickwork. The elevation has two low arched openings within the plinth and above them two secondary windows each of which has had a white render applied to the moulded brick jambs to simulate an ashlar Gibbs surround. The north elevation has a central doorway with stone arched lintel and it used to be ornamented by a crows step gable but this has been lost together with a window within the gable.
2.4.2 The interior of the larger building has been substantially altered due to a probably early $19^{\text {th }}$-century conversion of the building which involved the insertion of conventional ground and first floors. There are four ground and first floor principal joists in contrast to the five roof trusses. At the same time as the insertion of the floors the walls beneath the first floor principal joists were rebuilt to form piers capable of supporting the joists and many of the nesting boxes elsewhere in the walls were in-filled with brick and plastered over.

### 2.5 Roof description and principal structural members

2.5.1 As previously noted, neither of the roofs survived in-situ when the current survey was undertaken. The fallen timbers from the smaller dovecote had been removed from the site before the start of the current project but most of the fallen roof timbers from the larger dovecote remained within the building. From these, together with the survey drawings produced when the roof was at least partially intact (see Appendix 1) it is possible to gain a good impression of what form the roof from this building formerly took.
2.5.2 The roof had five arched-brace trusses, each one consisting of collar, principal rafters and pairs of arched braces resting on jack-corbels on top of the brick walls. The principal timbers were all of oak. Caiger reports that the trusses were unevenly spaced to allow for roof dormers in each of the penultimate bays towards each end (Caiger 1974, 38). The two wider bays are reported to have had four common rafters while the others had three common rafters. Each bay had a tier of curved wind braces beneath the single purlin which was clasped between collar and principal rafter. The principal rafter was supported by jack-corbels above the inner face of the walls and on a small wall plate resting immediately on the outer edge of the wall. There was no ridge piece.
2.5.3 The survival of the roof timbers was uneven; the larger ones (collars and arched braces) surviving relatively well while the smaller ones (rafters, wind braces) less so.
2.5.4 Four oak arched braces were identified with one in Bay B (B36) being in the best condition (Fig. 3). It was 2.65 m long by 12.5 cm thick with arched (by 22 cm at mid-point) and chamfered soffit. There were long tenons ( 3.5 cm thick with two peg holes) in the two sloped ends and there was a mortice in the upper face, towards the central point of the brace with the end of a 4 cm thick tenon which remained in-situ. This tenon would have secured the principal rafter to the brace.
2.5.5 Four oak collars were identified and again one in Bay B (B58) was in the best condition (Fig.4). The collar was 2.71 m long, 25 cm high at its mid point and 21 cm deep. It was slightly cambered and there were two mortices ( 60 cm long $\times 12 \mathrm{~cm}$ deep $\times 5 \mathrm{~cm}$ wide) towards each end of the underside. There were two peg holes to either side of each mortice and there was an iron loop projecting from the underside of each of the collars.
2.5.6 The principal rafters were of relatively small scantling tapering towards the head, and they have survived less well than the collars and arched braces. The best preserved example of principal rafter (F1) was leaning against the east wall, apparently having slid down from the roof structure, and was probably from the fourth truss from the north. It was 5.15 m long and its base was 14 cm wide by 9 cm deep. There was a 25 cm long rectangular through-mortice, 1.10 m from the base, which would probably have secured the rafter to the jack-corbel. There was also a small oval through-mortice 3.30 m from the base which would probably have secured the rafter to the purlin. Each end had two projections which suggest that the rafter pairs were secured together at their heads with a bridle joint.
2.5.7 No common rafters survived intact but several long fragments survive which do not have the longer mortice present on the principal rafters but do have the small oval through-mortice which secured the rafters to the purlin.
2.5.8 Only the most fragmentary remains of sections of wind brace survived, the largest of which (B24) was 47 cm long by 3.5 cm deep by 21 cm wide and had an arched shape suggestive of a wind brace. It had a 2 cm diameter peg hole.
2.5.9 Two further roof timbers of interest where identified. One of these (C2) was of similar dimensions as the collars and with the same cambered form but there were no mortices to its underside. Also of interest was a beam 3.59 m long by $17 \mathrm{~cm} \times 15 \mathrm{~cm}$ (E6). It had a mortice in its underside ( 13 cm long x 9 cm deep) and there appears to have been a mortice and peg hole in each of its two angled, upper corners.
2.5.10 No sections of purlin, wall plate or jack-corbel survived which could be positively identified.
2.5.11 Each of the ground floor principal joists remained at least partially in-situ although in parts some had largely disintegrated (Fig.6). The principal joist furthest north (between Bays A and B) was the best preserved and had mortices for 12 common joists (at 44 cm centres) within each side face with circular peg holes above each. The principal joist was 27 cm high by 28 cm wide. The ground floor common joists were 14 cm high by 11 cm wide by c. 2.50 m long and they had soffit tenons with diminished shoulder to each end (Fig.7).
2.5.12 The only first floor principal joist to remain fully in-situ was that between Bays C and $D$, although one end of each of the others remained in place with the other end fallen to the ground. They were 31 cm by 31 cm and had mortices and peg holes for 13 common joists at 39.5 cm centres. The lower edges of each principal joist were chamfered and had moulded stops (scroll stops with bar; see Fig. 5). The first floor common joists were 13.5 cm high by 11 cm wide and also had chamfered lower edge with plain stops (Fig.7).
2.5.13 Other than the structural timbers relatively few architectural fragments were recovered from the building. One exception was a pair of iron door hinges, c .70 cm long and with four evenly spaced nail holes.

## 4 CONCLUSION

3.1.1 Leeds dovecote forms part of a Scheduled Ancient Monument and it is therefore by definition of national importance. Its condition has deteriorated seriously in recent decades and the current stabilisation and clearance works have provided a good opportunity to undertake a initial phase of archaeological recording and salvage before important evidence relating particularly to the building's roof form was lost. It is anticipated that further recording will be undertaken on the dovecote if and when substantial works are carried out on the building.
3.1.2 The primary conclusion of the archaeological programme was to confirm the general form of the roof shown on the illustrations in Caiger's article. Examples of most of the main roof timbers were identified among the fallen debris within the dovecote and these timbers were both recorded (informing any possible future reconstruction) and retained for possible reuse within the building.
3.1.3 The site archive will be deposited with the Rochester Bridge Trust.

## APPENDIX 1: Register of timbers

The larger dovecote was divided into five bays, with Bay A furthest north, to allow the general location of each fallen timber to be recorded. Each timber was given a reference number prefixed by the letter of the bay in which it was found. The principal structural timbers which it was possible to identify have been emboldened in the table.

## Condition rating

The condition of most of the individual timbers found (and all of the principal structural members) have been given a rating out of ten. The purpose of this was to highlight which timbers are considered to have the potential for reuse and to identify the many timbers which were retained, because they had clearly once been significant elements of the dovecote's structure, but whose condition had deteriorated so badly that their nature could not be identified. In some instances one part of a timber survived in a much better condition than the other. In such cases two condition ratings have been given. A rating has not always been given where the timber retained is clearly a secondary member of lesser significance but which is in a good condition. Generally ratings were only given where the significance of the timber may have warranted its reuse if it was in a sufficiently good condition. With irregularly shaped objects the maximum dimensions in each direction has been given.

1/10: Very fragmentary rump. No edges at all, impossible to tell the original size, or type or function.
2/10: Again very fragmentary. Possibly small sections of edge survive but at no point do all 4 edges survive. Thus again impossible to tell original size and type.
3/10: Fragmentary. Can probably tell sectional size of member but not length or function.
4/10: Condition generally poor and no potential for reuse.
5/10: Basically intact but condition probably not good enough to allow any of it to be reused.
6/10: Generally good condition and elements could probably be reused, scarfed or spliced onto modern sections.
7/10: Good condition. Some parts could almost certainly be reused but not whole timber.
8/10: Member fully (or almost fully) intact and in generally good condition. Much of it could be reused, possibly with some parts re-formed or spliced on.
9/10: Good potential for reuse of whole member.
10/10: Almost perfect condition. Ideal for reuse.
Bay A

| Bay A |  |  |
| :---: | :---: | :---: |
| Ref No. | Description | Condition rating |
| A1 | First floor joist with chamfered underside. Not in-situ. Aligned NW-SE. $215 \times 16 \times$ 13. Edges all worn but joist basically intact although neither tenon. | 6/10 |
| A2 | First floor joist. Not in-situ. Aligned NW-SE. $235 \times 14 \times 11$. One tenon intact. | 5/10 |
| A3 | Softwood, not in-situ. $75 \times 5 \times 10$ |  |
| A4 | Newel post (?). Not in-situ, leaning vertically against E wall. $340 \times 14 \times 14$. | 4/10 |
| A5 | Rafter (?). Two projections at both ends. Not in-situ, aligned E-W. $389 \times 14 \times 8$. | 3/10 |
| A6 | First floor joist; not in-situ. Aligned E-W on top of ground floor joists. $225 \times 13 \times 11$. Tenons lost at both end. | 5/10 |
| A7 | Loose fragment. $122 \times 13 \times 7$. | 2/10 |
| A8 | Loose non-structural board, not in-situ towards centre of bay. $153 \times 10 \times 3$. |  |
| A9 | Loose non-structural board, not in-situ towards centre of bay. $149 \times 10 \times 3$. |  |
| A10 | Ground floor joist ( $6^{\text {th }}$ from E). $214 \times 13 \times 13$. | 6/10-2/10 |
| A11 | Loose fragment aligned E-W. $147 \times 24$ (max) $\times 14$ |  |
| A12 | Ground floor joist ( $3^{\text {rd }}$ from E). $235 \times 13 \times 13$. In-situ. $235 \times 13 \times 11$. Notch towards N end similar to that in A21 | 3/10 |
| A13 | Arched brace lying over ground floor principal joist between Bays A and B. $212 \times 10$ x 13 . | 5/10 |
| A14 | Ground floor joist ( $2^{\text {nd }}$ from E), in-situ. $230 \times 12 \times 12 . S$ end tenon partly intact. | 4/10 |
| A15 | Softwood plank, loose against the E wall lying over ground floor beam between $\mathrm{A}+\mathrm{B}$. $248 \times 12 \times 5$ |  |
| A16 | Loose fragment against E wall. $83 \times 24 \times 10$. | 2/10 |
| A17 | Softwood secondary member. Possibly window mullion. $105 \times 7 \times 5$. |  |
| A18 | Ground floor joist ( $8^{\text {th }}$ from E). Not in-situ. $230 \times 13 \times 10$. S end partly intact. | 4/10 |
| A19 | Ground floor joist (9 ${ }^{\text {dh }}$ from E). Not in-situ. $226 \times 13 \times 10$. Neither tenon intact. | 4/10 |

| A20 | First floor joist stuck vertically in ground/debris. $195 \times 13 \times 10$. | $3 / 10$ |
| :--- | :--- | :--- |
| A21 | Ground floor joist (No 1 from E). In-situ. $241 \times 12 \times 14$. Notch 27 cm long $\times 2.5 \mathrm{~cm}$ <br> deep, 21 cm from N end. | $3 / 10$ |
| A22 | Loose towards centre of bay, aligned N-S. 163 long. | $2 / 10$ |
| A23 | Loose towards centre of bay. $194 \times 12 \times 10$. | $2 / 10$ |
| A24 | Post; probably staircase newel with through mortice at one end for handrail (?). $91 \times 10$ <br> $\times 10$. Not in-situ. | $5 / 10$ |
| A25 | Loose member probably relates to former staircase. $108 \times 11 \times 8.4$ mortices regularly <br> spaced 5 cm deep $\times 9 \times 3 \mathrm{~cm}$. | $5 / 10$ |
| A26 | First floor joist, not in-situ towards W end. $213 \times 11 \times 14$. | $6 / 10$ |
| A27 | First floor joist, not in-situ towards W end. $215 \times 11 \times 14$. | $6 / 10$ |
| A28 | Ground floor joist $\left(10^{\text {th }}\right.$ from E) $236 \times 13 \times 12$. S tenon partly in-situ. | $6 / 10$ |
| A29 | Loose softwood block. $50 \times 12 \times 9$ | $4 / 10$ |
| A30 | Loose softwood block. $51 \times 15 \times 6$ | $1 / 10-7 / 10$ |
| A31 | Minor post/bearer not in-situ. $140 \times 7 \times 7$. | $3 / 10$ |
| A32 | Ground floor joist $\left(11^{\text {th }}\right.$ from E). S tenon almost complete. | $3 / 10$ |
| A33 | Section of floor board from SW corner of bay. $22 \times 2.5 \mathrm{~cm}$. |  |
| A34 | Loose fragment at W end. $59 \times 19 \times 11$. | $2 / 10$ |
| A35 | Loose fragment. $81 \times 8 \times 8$. Circular peg hole 2.5 cm dia. 9 cm long through mortice. |  |
| A36 | Loose fragment $110 \times 12 \times 6$. | $8 / 10-4 / 10$ |
| A37 | Ground floor joist $\left(12^{\mathrm{dh}}\right.$ from E, ie furthest W) $247 \times 14 \times 11$. | $3 / 10$ |
| A38 | Loose fragment at E end. $54 \times 8 \times 7$. |  |
| A39 | 70 cm long fragment, possibly from arched brace. |  |
| A40 | $8 \times 9 \times 48$ fragment with circular peg hole |  |
| A41 | $35 \times 12 \times 12$ fragment. |  |
| A42 | $62 \times 12 \times 12$ fragment. |  |

## Bay B

| B1 | Rafter (?). Resting partly on first floor beam at W side of building. $365 \times 11 \times 6.17$ cm through mortice at centre, 187 from one end. | 3/10 |
| :---: | :---: | :---: |
| B2 | Rafter (?). $260 \times 8 \times 11$. Through mortice 75 cm from one end. | 4/10 |
| B3 | Rafter (?). loose, slightly submerged at W end of bay. $193 \times 12 \times 6$. Apparently half a through mortice at point of break. | 3/10 |
| B4 | Loose, found on surface towards centre of bay. $190 \times 15 \times 10$. Through mortice 5 cm wide. |  |
| B5 | Loose towards centre of bay. $190 \times 15 \times 10.4$ peg holes towards centre. | 4/10 |
| B6 | Loose fragment towards west end. $90 \times 10 \times 5$. | 2/10 |
| B7 | Loose fragment towards W end of bay. $120 \times 15 \times 10$. Golden colour, similar to B4. | 3/10 |
| B8 | Fragment to W. $210 \times 10 \times 5$. | 3/10 |
| B9 | Ground floor joist (furthest W) N end + tenon intact. $72 \times 15 \times 10$. | 3/10 |
| B10 | First floor joist towards W end of bay. $219 \times 14 \times 11$. | 1/10-5/10 |
| B11 | Ground floor joist (furthest W). S end of B9. $120 \times 15 \times 12$. Tenons don't survive. | 4/10-1/10 |
| B12 | First floor joist (probably) towards W end of bay. Resting on top of ground floor principal joist. $212 \times 12 \times 9$. | 3/10 |
| B13 | First floor joist at W end. $232 \times 13 \times 10$ S end tenon partly in-situ. | 5/10-3/10 |
| B14 | Probably stair newel post found on surface towards centre of bay. $150 \times 20 \times 20$. Rounded top. 4 rectangular slots in one face, 4 diagonally-set square slots in other face. | 7/10 |
| B15 | Rafter (?) $390 \times 12 \times 7.1$ small slot at centre. | 4/10 |
| B16 | First floor joist at E end of bay $230 \times 14 \times 11$. | 4/10 |
| B17 | Loose towards E end of bay. $120 \times 13 \times 8$. Softwood |  |
| B18 | Loose fragment towards E end of bay. $100 \times 8 \times 18$. | 4/10 |
| B19 | Loose fragment towards E. $81 \times 22 \times 5$. |  |
| B20 | Loose fragment towards E. $130 \times 15 \times 10$. | 4/10 |
| B21 | Loose fragment towards E. $46 \times 41 \times 5$. Trap door formed of several pieces of softwood board. Iron hinges |  |
| B22 | Loose fragment towards E. $70 \times 13 \times 8$ block with bridled end. | 4/10 |
| B23 | Loose fragment towards E. 10 cm thick irregularly shaped block. c. $45 \times 33 \mathrm{~cm}$. |  |
| B24 | Loose fragment towards E. Possibly small section of wind brace. $47 \times 3.5 \mathrm{~cm} \times 21$ with peg hole ( 2 cm diam) |  |

| B25 | Loose fragment towards $\mathrm{E} .38 \times 6.5 \times 9$, softwood with both upper edges chamfered (at one end). |  |
| :---: | :---: | :---: |
| B26 | Loose fragment towards E. two small softwood cross members fixed together at the centre with iron bolt. |  |
| B27 | Loose fragment towards E. Non structural softwood plank. $30 \times 8 \times 5$. |  |
| B28 | Loose fragment towards E. softwood trap door (?). $51 \times 31$. |  |
| B29 | Loose fragment towards E. Plank, $144 \times 16 \times 4$. |  |
| B30 | Loose fragment towards E. Triangular section softwood member. $118 \times 14 \times 5 \mathrm{~cm}$. |  |
| B31 | Loose fragment towards E. Possibly small section of wind brace $110 \times 20 \times 4$, curved. | 2/10 |
| B32 | Loose fragment towards E. Trap door (?) similar to B21. |  |
| B33 | Loose fragment towards E. Softwood, non structural. $1 \mathrm{mx} 10 \times 7$. |  |
| B34 | Loose fragment towards E. 90 cm long softwood plank. $8 \times 5 . \mathrm{s}$ |  |
| B35 | Loose fragment towards E. Similar to B34. |  |
| B36 | Arched brace atE end of bay. Condition good. 262 cm long $x 12.5 \mathrm{~cm}$ thick. Tenons at each end at right angles to each other. Mortice at centre of upper face. | 8/10 |
| B37 | Loose fragment. $87 \times 10 \times 8.2$ peg holes. | 2/10 |
| B38 | Fragment. $140 \times 12 \times 6$. | 1/10 |
| B39 | Newel post with pyramid head. 3 slot mortices on one side. |  |
| B40 | Fragment. $158 \times 13 \mathrm{~cm}$. |  |
| B41 | Softwood fragment with iron hinge fixed to it. $35 \times 10 \times 7$. |  |
| B42 | $10 \times 53 \times 7$ softwood. |  |
| B43 | $195 \times 23 \times 14$ fragment. 18 cm through mortice at centre. | 3/10 |
| B44 | Loose fragment. $58 \times 17 \times 18$ block. | 3/10 |
| B45 | First floor joist fragment. 110 long. 2/10. | 2/10 |
| B46 | Collar fragment towards centre of bay. $122 \times 14 \times 17$. | 3/10 |
| B47 | Small fragment of floor board lying in-situ on ground floor joist (B48). |  |
| B48 | Ground floor joist in-situ. ( $3^{\text {rd }}$ joist from W). Almost intact but neither tenon. 235 long. | 3/10-7/10 |
| B49 | Loose fragment. W of centre of bay $214 \times 14 \times 9.3$ small circular holes towards centre. | 3/10 |
| B50 | Loose fragment towards centre of bay. $96 \mathrm{~cm} \times 10 \times 5$. | 2/10 |
| B51 | Ground floor joist ( $7^{\text {th }}$ from E) 237 long. Part of N tenon intact. | 5/10 |
| B52 | Loose fragment found at $E$ end of bay. $150 \times 24 \times 19$. Possibly section of collar, 4 cm wide mortice. | 3/10 |
| B53 | Loose fragment. $144 \times 14 \times 11$. Probably first floor joist. | 4/10 |
| B54 | Loose fragment. $123 \times 16 \times 12$. |  |
| B55 | Loose fragment $120 \times 10 \times 10$. | 1/10 |
| B56 | Loose fragment from collar (?) with iron loop/hook. 1 m long $17 \times 12$. | 1/10 |
| B57 | Ground floor joist ( $5{ }^{\text {th }}$ from E) 150 long. | 7/10-2/10 |
| B58 | Collar found on surface to E side of bay, lying over ground floor beam between bays B and C. $271 \times 25 \times 21 \mathrm{~cm}$. | 6/10 |
| B59 | Loose block to E side of bay. $120 \times 27 \times 12$. Possibly beam for staircase. Condition good. $5 \mathrm{~cm}^{2}$ through mortice at centre. |  |
| B60 | Loose piece. Probably relates to staircase. Two pieces softwood fixed together at right angles to each other. |  |
| B61 | Similar to B60 |  |
| B62 | Loose fragment. $140 \times 12 \times 9.2 / 10$. |  |
| B63 | Loose fragment. |  |
| B64 | Ground floor joist ( $5^{\text {th }}$ from W) S end in-situ. 235 cm long. | 7/10-3/10 |
| B65 | Ground floor joist (not in-situ) 235 cm long. | 7/10-3/10 |
| B66 | Ground floor joist ( $6^{\text {th }}$ from E) 230 cm long. | 7/10-3/10 |
| B67 | Ground floor joist ( ${ }^{\text {nd }}$ from E). 239 cm long. Only one tenon survives. | 6/10 |
| B68 | Ground floor joist ( ${ }^{\text {rd }}$ from E) 230 cm long. | 2/10-5/10 |
| B69 | Ground floor joist (furthest E) 230 cm long. | 5/10 |

## Bay C

Bay C

| C1 | Loose fragment on surface, close to W wall. $120 \times 10 \times 10$. | $3 / 10$ |
| :--- | :--- | :--- |
| C2 | Roof member. N-S close to W wall. $262 \times 22 \times 14$. Similar to collars but no mortices <br> to underside and no hook. Slightly cambered underside. | $6 / 10$ |
| C3 | Loose fragment to W of centre of bay. $140 \times 3 \times 10$. | $2 / 10$ |

| C4 | Loose fragment to W of centre of bay. $60 \times 5 \times 5$. | $1 / 10$ |
| :--- | :--- | :--- |
| C5 | Loose fragment to W of centre of bay. $120 \times 8 \times 5$. | $1 / 10$ |
| C6 | Loose fragment to W of centre of bay. $222 \times 15 \times 6$. | $2 / 10$ |
| C7 | Loose fragment to W of centre of bay. $150 \times 5 \times 10$. |  |
| C8 | Loose fragment to W of centre of bay. $110 \times 7 \times 7$ | $6 / 10$ |
| C9 | Collar. E-W towards centre of bay. 2 mortices in underside, c. 48 cm long. Iron loop <br> towards centre. $267 \times 24 \times 16$ |  |
| C10 | Loose fragment. | $2 / 10-6 / 10$ |
| C11 | Ground floor joist (4 $4^{\text {th }}$ from W) 223 cm long. 0.5 m furthest N. | $2 / 10$ |
| C12 | Ground floor joist (3d from W). Only 40 cm furthest N survives. | $2 / 10$ |
| C13 | Fragment towards centre of bay $218 \times 13 \times 5$. | $2 / 10$ |
| C14 | Rafter towards centre of bay. $295 \times 12 \times 8.10 \mathrm{~cm}$ central mortice | $3 / 10$ |
| C15 | Arched brace fragment at E end of bay. 128 cm long. | $2 / 10$ |
| C16 | Loose fragment at E end of bay. $75 \times 18 \times 20$. Possibly post which sat on top of wall <br> and held arched braces. | $2 / 10$ |
| C17 | Rafter at E end of bay. Oval slot at centre. $372 \times 13 \times 6$. | $1 / 10$ |
| C18 | Loose fragment at E end of bay. $160 \times 10 \times 13$ with 2 oval through mortices. | $2 / 10$ |
| C19 | Loose fragment at E end of bay. $115 \times 12 \times 12$. | $5 / 10-2 / 10$ |
| C20 | Ground floor joist (No 1 from E ). 215 long. | $2 / 10$ |
| C21 | Loose fragment at E end with $8 \times 3.5$ tenon at one end. $70 \times 15 \times 15$. | $4 / 10$ |
| C22 | Ground floor joist (not in situ but probably No 2 from E). $153 \times 17 \times 11$. | $4 / 10$ |
| C23 | Ground floor joist not in-situ. $200 \times 12 \times 10$. | $3 / 10$ |
| C24 | Fragment towards centre of bay. $160 \times 14 \times 11$. | $2 / 10$ |
| C25 | Fragment towards centre of bay. $162 \times 12 \times 12$. | $2 / 10$ |
| C26 | Fragment towards centre of bay. $194 \times 12 \times 12$. |  |

| Bay D |  |  |
| :---: | :---: | :---: |
| D1 | Arched brace, against $W$ wall on surface. 244 cm long. Intact but neither tenon. Condition. | 4/10 |
| D2 | Rafter (?). Towards centre of bay, orientated E-W. $275 \times 11 \times 6$. Small ( 4 cm ) oval through mortice towards centre. | 4/10 |
| D3 | Rafter on surface to W of centre, orientated N-S. $396 \times 13 \times 6$. Condition relatively good for rafter. | 5/10 |
| D4 | First floor joist (probably), orientated E-W lying on ground floor principal joist between Bays D and E. $206 \times 13 \times 10$. | 4/10 |
| D5 | First floor joist (probably). 215 long. | 4/10 |
| D6 | Loose fragment. 120 cm long. | 1/10 |
| D7 | Loose fragment. $125 \times 17 \times 10$. Condition v poor but possibly post which held base of arch brace (??). Two projections at one end and one projection at other although it may just be how the piece has broken from a large member. | 1/10 |
| D8 | Rafter. Loose on surface N-S towards centre of bay. $317 \times 10 \times 6$. | 5/10 |
| D9 | Loose fragment on surface, N -S towards centre. $250 \times 13 \times 8$. |  |
| D10 | Collar. Both mortices intact with 2 holes each end. 267 long. | 5/10 |
| D11 | Rafter. Standing vertically against E wall at S end of bay. 506 cm long. Maximum existing depth 8 cm long although one face largely disintegrated. Large mortice ( 25 cm long) to house end of wind brace with partly surviving peg hole. Small oval through mortice towards other end to house purlin (?). | 5/10 |
| D12 | Rafter. Standing vertically against E wall at S end of bay. $370 \times 12 \times 6$. Oval slot ( 12 cm long) 160 from one end. |  |
| D13 | Loose towards centre of bay. $193 \times 11 \times 8$ fragment. Bit of rafter (?). | 1/10 |
| D14 | Loose towards centre of bay. $180 \times 13 \times 5$ fragment bit of rafter (?). | 1/10 |
| D15 | First floor joist, N-S towards E side of bay. Half in Bay C, resting on ground floor joist. 215 cm long. | 3/10 |
| D16 | Loose on surface close to centre. $80 \times 11 \times 8$. |  |
| D17 | Loose on surface close to centre of bay. $115 \times 10 \times 12$. |  |
| D18 | Ground floor joist ( $5^{\text {th }}$ from E). In-situ. 210 cm fragment. | 4/10 |
| D19 | Loose fragment along spine of bay. $220 \times 17 \times 6$. | 2/10 |
| D20 | Loose on surface. 100 cm fragment. | 1/10 |
| D21 | Loose on surface in E half of bay $110 \times 7 \times 7$. Minor post. | 4/10 |
| D22 | Minor softwood post. $160 \times 7 \times 7$. |  |

| D23 | Loose against E wall. $130 \times 15 \times 7$ fragment. Long projections at each end. | $2 / 10$ |
| :--- | :--- | :--- |
| D24 | Softwood, non structural. Loose next to E wall. $119 \times 12 \times 6$. Notch cut towards centre. |  |
| D25 | Loose next to E wall. $200 \times 10 \times 5$. Fragment |  |
| D26 | Loose member lying over ground floor joist between bays C and D. N-S. $109 \times 11 \times 9$. | $2 / 10$ |
| D27 | 220 cm long tree trunk, possibly used as secondary structural addition 10 cm diam with <br> cut off branch nodules intact. |  |

Bay E

| E1 | First floor joist. Stuck vertically in ground, just W of centre. $200 \times 17 \times 12$. | $4 / 10$ |
| :--- | :--- | :--- |
| E1 | First floor joist. Stuck vertically in ground, just W of centre. $200 \times 17 \times 12$. | $4 / 10$ |
| E2 | First floor joist. Vertically lying against W wall. 185 long. | $4 / 10$ |
| E3 | Arched brace. Aligned SW-NE. Main body fully intact and 1 end tenon. Mortice at centre <br> of upper face with fragment of tenon remaining in-situ. Probably reusable. | $7 / 10$ |
| E4 | Loose fragment of board 50 cm long. |  |
| E5 | Loose fragment, possibly joist. 50 cm long. $2 / 10$ | $2 / 10$ |
| E6 | Roof member (?) Lying over first floor principal joist between bays D and E. Apparently <br> unique structural member. $360 \times 17 \times 15$ with mortice at centre of underside (mortice 13 cm <br> long x 9 cm deep). |  |
| E7 | Rafter. Loose, lying over E6. $343 \times 11 \times 12.12 \mathrm{~cm}$ mortice towards centre. $11 \times 12 \mathrm{~cm}$. | $3 / 10$ |
| E8 | First floor joist. Towards centre of bay. 190 cm long. | $4 / 10$ |
| E9 | First floor joist. 200 cm long. Towards centre of bay. | $3 / 10$ |
| E10 | Fragment. $150 \times 10 \times 7$ | $4 / 10$ |
| E11 | First floor joist. 200 long. | $4 / 10$ |
| E12 | First floor joist lying on surface. $160 \times 14 \times 14$. |  |
| E13 | Wind brace (??). E of centre, Small fragment $-120 \mathrm{~cm} \times 4 \mathrm{~cm}$ thick. | $2 / 10$ |
| E14 | Fragment (possibly rafter ?). 140 cm long. Stuck vertically in ground towards E. | $3 / 10$ |
| E15 | Rafter (?) Orientated E-W. $310 \times 10 \times 5.20 \mathrm{~cm} \mathrm{mortice} \mathrm{at} \mathrm{centre}$. |  |
| E16 | Loose fragment towards centre. $138 \times 15 \times 10$. | $4 / 10$ |
| E17 | Loose on surface. $100 \times 9 \times 6$. |  |
| E18 | Arched brace. On surface against E wall. Intact (withough tenons) but condition poor. |  |

## Area F (area outside dovecote to E)

F1 $\quad$ Rafter in relatively good condition. 515 cm long $x 8 \mathrm{~cm}$ deep at deepest.
1101.3
f. 'I'

INer, its l. --- - ind r $\qquad$ 11 plavionan shat the top of the longer Iadder gives access to a puir of trap-doors, nimmally left open, just below the four external flight openings at the Dusise of the lantern. At certain times of the year, however, it was aneessary to prevent some of the birds from leaving the house; at these ferioxls the two trap-doors would be shut. The stractural arrangements lor supporting the heavy canopy and roof-lantern are sturdy and sitraightforward; the entire load imposed by both the roof and canopy in taken by four stout vertical posts on to two $10 \mathrm{in} .(0.25 \mathrm{~m}$.) spuaresetion horizontal beams, which span the north-west and south-enst walls. The lower ends of these posts are tenoned and pegged into the Two leams. To add further stability, two additional half sets of horizonlal heams are tenoned and pegged to the full pair ut right angles. Their cmils rest on the north-east and south-west walls. Two side struts are fiticica to euch of the verticul inembers at right angles, their lower ends lecing set into the horizontal Leams to resist any side movement. Whilst the principal members surporting the roof and canopy loading wero lesing examined, it was noted that their respective mortice and tonon joinlss all bore carpenterg' marks. These were in the usual form of shaillow cuts made in the timber close to each joint. Single and multiple strokes, up to four in number, haud been used, the numeral 5 being indicated by an inverted Roman $V$. Larger numerals were mule up of ligatared forms of $X$ und inverted $V$ with oblique strokes through them.

## Lamis Abbuy Pigeon House

Sict amongst the present outbuildings of Ieeds Abbey Farm, L.ceds, near Maidstone, are the standing remains of a small pigeon honse Which is separated by an ulley 4 ft . ( 1.22 m .) wide from another longor building. This too, had once served as a pigeon house. (N.G.R. TQ yweste0.) The larger building is known locally as 'the Chapel or The Nill; both of these buildings are now roofless and in ar ruinons condition and, ly some curious oversight, neither building appears to have any protcection order on it. An examination ly the writer clearly showed Whit during the past three centuries structural modifications have leen minde to them from timo to time, and the purpose of his pmper is an atlempt to trace these alterations in a chronological order.

The land on which the two buildings stand once belonged to the Augustinian Priory of Leeds, founded c . 1119 A.D., the site of which licss 160 ft . ( 140 m .) north-eastwards. The priory was suppressed in 1639 und afterwards passed into the possession of Warham St. Leger, of Ifeombe, and then to Francis Colepepper. By 1598, or a little later, Ho property had passed to William Covert, who may have udded the north fromt. In 1610, the building was sold to William Meredith and it Gombinned in his family until 1765, when the honse and estiato wero again
sold, this time to John Caleraft, a woolthy native of Dorset. Tinally, in 1790, tho houso was pulled down and the present farmhonse, known as Leeds Abbey Tarm, was built on tha hill to the west of tho site of the honso.

## Description of the hoo existing Iiyeon Houses

The smaller building measures $17 \mathrm{ft} \times 12 \mathrm{ft}$. ( $5 \cdot 18 \times 3 \cdot 65 \mathrm{~m}$.) internally, with three of its wnlls 3 ft .6 in . ( 1.07 m .) thick; the building is constructerd of red brickwork laid in English Bond. Tho footings aro of stone rubble and the lower level of the building is stone-faced. Approximately 105 nesting-boxes are arranged in eleven rows on the east wall whilst the south and west walls contain 143 and 110 boxes, respectively. Alighting lelges, formed by a projecting briekwork course are provided for the pigeons below the box oponings. The north wall is not original and has been inserted at a much later date. It is only 1 ft .3 in . ( $0 \cdot 38$ m.) thick and does not contain nesting-boxes. The stile of a wooden ladder and its wood anchorages are still visille on this wall. Tho entrance to the building is through a narrow four-centred stone doorway, the mouldings and stops of which indicate an enrly sixteonthcentury dato. Four flight openings wero formerly provided at eaves' lovel for the pigeons. The roof timbering and tiling have disappeared but, fortunately, its form, of a simple tile-hipped roof is preserved in photographs taken in 19.4.4 Tho adjacent and larger building is in alignment with the small pigeon house and was once joined to it. This building shows evidence of soveral structural changes over the last two centuries. Its present-day appearance, however, both externally and internally, bears little resemblance to the conventional pigeon house, though this is what it mudoubtedly was. Its northern end is gabled in a distinetive form known ns Corbie Steps or Crowsteps. The building is constructed in red brick work to mateh the smaller building, and is also laid in English Bond. A moulded four-centred stone doorway, the step of which is 3 ft . ( 0.91 m .) aloove ground level, provides the only access to this building. A flight of five stone-steps was once set below this entrance. Above the doorway there is a double-light window formed in rubbed brickwork. At a later date, this window was embellished by plastering a thin mortar-coating on top of the brickwork simulating the ashlar Gibbs Surround much favoured in buildings of the eighteenth century. The eastern elovation of this building is most striking. Two hipped dormer windows were set at a low level on the roof; they wero of plain construction and nothing remains today to indicato if they were once glazed. Two single-light windows are set into the enst wall and, in common with the donble-light on the northern face, have also

[^0]heen decorated with a mortared surround, giving them a disthotly eeclesiastical appearance. These windows are a later insertion mud linve heen made to match the original northern window. The lower level of the brickwork is decorated with diaper work of simple lozenge form. It will be noted from the north elevation on the drawing, Ifig. 2, that the ground slopes away considerably towards the enst and, accordingly, This eastern wall has been strengthened with buttresses to resist any luilding movement. Today, there only remains the uppor part of one of He buttresses, the others having collapsed; scars in the brickwork, however, remain to indicate their former position. The lower portion of the building is faced with uncoursed random rubble, set in mortar, the junction between brickwork and stone rubble being finished with moulded plinth-stones. Beneath the windows and riear ground level two brick arched openings in the wall are to be noted. These, too, are late iusertions and serve to ventilate the space beneath the ground floor (to be noted later) inside the building. One of the ventilation openings has been sealed off with stone blocks and the other one is now partly sealed. The inside of this huilding presents a surprising appoarance and, as has been previonsly remarked, does not on first examination appear to havo ever been used as a pigeon house. This impression is ontirely duo to the insertion of two floors which have transformed its internal appearance. At threshold level, a wooden floor has been inserted, which is partly supported on four centrally-disposed brickwork piers. At 8 ft .6 in . $(2 \cdot 59 \mathrm{~m}$.) above this floor, an upper floor has been constructed on four massive oak-heams set transversely across the eastorn and western walls. A wooden stairway on the left-hand side of the entrance gives access to this upper floor. The balustrade posts at the top of this stairway are surmounted by three carved wood finials of seventeenthcentury dato. They are much worn and give the appearance of having been in use elsewhore. The oak-timbering of the roof is unusual and not The type of construction associated with a pigeon house. It is $n$ roplacement, and the timbers used may have been recoverel from tho old mansion after its demolition at the end of the eighteenth contury. The roof-timbering consists of six bays of unequal width. It is of the buttpurlin, arch-brace collar truss type. Wach principal rafter and its archbrace are supported by a wooden jack-corbel, the rafter ends resting on wall-plates at their extremities. The principal rafters are toothed into the purlins, after which point their section is reduced to that of the common rafters up to the ridge. The collars are in turn notched to the purlins. Curved wind-braces are fitted to the principals and secured in position with onk-pegs. Details of the roof construction are shown on the drawing in Sections $\mathrm{A}-\mathrm{A}$ and $\mathrm{B}-\mathrm{B}$, Fig. 2.

From the available historical evidence, together with a close inspertion of the two buildings, the following possible chronology is suggested.

## TWO KLENT PIGEON HOUSES

At the dissolution of the monastery, in 1539, the number of nonks and lay brothers living there wero very few, so the small pigeon house, at that time mensuring about $24 \mathrm{ft} .(7 \cdot 31 \mathrm{~m}$.) square and probnbly dating from the early part of the sixteenth century, was adequate for the community. As has been notel earlior, the monastio house known as Leeds Abboy had been partly rebuilt by William Covert at the end of the sixteenth century ${ }^{5}$ and, presumably, had a large number of people in residence. By the time the estate had become the property of the Meredith family the produce from this small pigeon house was totally inadequate for the needs of this new household. Therefore, it was greatly extended lengthwise. 'Ihe large pigeon houso was built with its southern end butted on to the northern wall of the smaller house, making one long continuous building. This assumption is completely jnstified in a viow of Leeds Abbey drawn by J. Badslade, c. 1720, ${ }^{\circ}$ which depicts the long pigeon house in its correct position and complete with buttresses, dormer windows and the northern doorway. This old engraving also shows a louvre or glover over the pigeon house at its southern end. Significantly, no windows or floor-ventilation openings are shown on the enstern wall. At this period the mansion nud estate were owned by Roger Meredith. John Caleraft purchased the property in 1765 and soon began enlarging the residence and making improvements to the grounds, which at that time were laid out in the conventional formal style of the seventeenth century. Lancelot 'Capability' Brown, the landscape gardener, was commissioned by Caleraft to transform the existing gardens and he began the work early in 1771.7 It is believed that amongst Brown's improvements were the making of the large lake, still to be seen today, and what is more pertinent to this paper, the alterations to the exterior of the pigeon house to convey the impression, when viowed from a distance, that it was a chapel. It was quite common practice for landscape gardeners of the eighteenth century to disguise utilitarian buildings with a sham façade. Capability Brown was fond of providing his patrons with a skyline view of $a$ church or chapel, such as the one he created at Danson Park, Boxley, still known as the Chapel Honse. It is likely that Brown was responsible for inserting the two windows in the eastern wall of the pigeon house and framing these and the existing northern window with a mortar coating to simulate stone quoins. There is no doubt that the two eastern wall windows are a later insertion; this can be clearly seen inside the honse by the mutilated brickwork courses and the destruction of the nesting-boxes near the windows. A small recess, about $3 \mathrm{ft} . \times 4 \mathrm{ft}$. $(0.91 \times 1.22 \mathrm{~m}$.) wide was made 18 ft . $(5.48 \mathrm{~m}$.) from the sonthern end

of the building; this, presumably, broke the line of the long building and strengthened the illusion of a church or chapel. Brown received uver $£ 2,000$ for his share in the work of re-designing the garden. ${ }^{8}$ 'The ereation of a largo lake was a typical improvement favoured by Brown nut the Leeds Abbey lake is a fine example of his work. The drawing by J. Badslade, referred to earlier, shows a complex series of waterliasins, fountains and a suuken water-garden on the right-haud side of the mansion, fed by distant springs. Capability Brown's take covers much of the area formerly occupied by the water-gardens and has obviously been contrived by widening and linking the waler-courses bank to their source at these springheads. Today, there aro still four netive springs feeding the lake at its sonth-western end. Capability Brown might have been commissioned to make further improvements (1) the grounds of Leeds Abbey had not John Calcraft been seized by an illness in 1772 from which he died at his home at Ingress Albbey, ( Irenhithe, at the comparatively early age of forty-six. ${ }^{0}$ Alter John ('aleraft's death the estate passed to his son John, who appears to have neglected the property. In 1790, the imposing mansion was pulled down and, at about this time or a little later, Leeds Abbey farmhouse was built. The ensuing period between 1790 and 1840 is a difficnlt one to evaluate with any certainty, as most of the evidence is circumstantinl. It may be assumed that the needs of the farmhouse would not require the produce of such a large pigeon house, and it is suggested that it was about this time that the extensive internal structural changes were made to the building.

A close examination of the internal walls revealed that they had lowen rendered with clay daub containing a large amount of chopped straw. The surface of the walls had been lime-washed, many coats hoving been applied over the years. Beneath the clay rendering, the earlier pigeon nesting-boxes were found. All the boxes, with the exception of those out of view beneath the ground-floor, had been deliberately sealed off by wedging two bricks into the openings and moking them securely with a piece of broken tile. Beneath the holes were the remains of the alighting ledges. Each of the ledges had been roughly hacked off, leaving rows of jagged brickwork across the wallraces. Roofing-tiles, laid face downwards on to the walls under the daub, had been used to level out these surface irregularities. Nesting-boxes had been set into the eastern and western walls, arranged in ten rows per wall; a few nesting-boxes were also discovered under the clay rendering on the northern wall. By estimate, the total number of boxes on the three walls would have been about 620, which when added to those in the small pigeon house, would have provider accommodation

## TWO KEN'T PIGEON IIOUSES

Sor some 1,120 pairs of bircls. The lower and upper floors wero inserled nud the two arched underfoor ventilation openings cut through the hriekwork of tho eastern wall. The onk-timbered replacement roof was installod together with the sinirwny belween the two floor-lovels,

Reference (n) tho 'Itithe Avard Map revealed several interesting points. From the Apportionments it was noted that certain parcels of fund around the farm were exempt from tithes. The surveyor, J. Tootell, has endorsed the map wifh a note stating that tho buildings shown within the exempted parcels, one of which includes the pigeon house, were not the result of his field measurements but were extracted aikl copied from 'old surveys'. The long pigeon house is shown in its correct position and bears a shallow recess at the exact position where tho present alleyway separating the two buildings has been cut. The small pigeon house was detached from the larger building ly extending the recess along and out through the western wall. This necessitated removing nearly all of the northern wall of the small early pigeon house, destroying the nesting-boxes and leaving the header brick-courses roughly eut through on the right-hand side of the alleyway. On the loft-hand side a now wall, only 1 ft .3 in . ( 0.38 m .) in thickness was milt to the small pigeon house and fitted with its near pyramidal roof as shown on the drawing. The southern buttress was removed completely and the two corners on the eastern wall repaired to matel the existing briokwork.

It has not beon possible to ascertain for what purpose the larger pigeon house was converted into a two-storied building, complete with elegant staircase and finely-made roof-structure. In 1910, the building was known as the Chapel, and the Rev. C. H. Fielding briefly refers to it in an article on Leeds Abbey. ${ }^{10}$ The alternative name, the Mill, could be based on a misinterpretation of an old photograph of the building which shows a white flour-like deposit adhering to the external walls in and around the two window-openings. ${ }^{11}$ An elderly resident of Leeds village recalls that during this time, the building was used to accommodate families of hop-pickers. Wach season before their arrival, it was the practice of the farmer tos have the inside walls sprayed with lime wash, some of which escaped through the window-openings and became coated on the external walls, as seen in the photograph.
